

T3 final-EFT one-loop RGE term comparison: EFT_2_after_S1_S2

All T3 particles have been integrated out at this stage. The active theory is the SM plus the dimension-five Weinberg operator. Rows are the UV model configurations that produced the matched coefficient, while columns align the additive structures in its one-loop beta function. Each populated cell contains the complete term, including its coefficient and the factor C_5 . We use $16\pi^2\,\mu\,dC_5/d\mu = \beta_{C_5}^{(1)}$.

$$\beta_{C_5}^{(1)}$$

$$16\pi^2\,\mu\frac{dC_5}{d\mu} = \beta_{C_5}^{(1)}$$
