

## T3 intermediate-EFT one-loop RGE term comparison: EFT\_1 after $F$

This stage has active field content  $\text{SM} + S_1 + S_2$ . The report combines the renormalisable RGE running with the dimension-five  $\psi^2\phi^2$  Wilson-coefficient running generated after integrating out  $F$ . Throughout,  $16\pi^2 \mu dX/d\mu = \beta_X^{(1)}$ . For the Wilson sector only the tree-generated stage-1 coefficient  $C^{(0)}$  is inserted into the one-loop anomalous dimension; the one-loop threshold piece is retained as a boundary term and is not run again at this order.

### Notation key

| symbol                    | interaction / definition                                           |

# Dimension-five $\psi^2\phi^2$ Wilson coefficients

The Wilson tensor is reported in the real-scalar component basis  $C_{ijab}$ . Each component with a nonzero one-loop beta function has its own table. Components absent at the matching boundary but generated by operator mixing are included automatically.
